Scaling Global South Climate Solutions | Optivide

We support people in solving the climate problem with financial confidence.

Challenge

Without finance, climate action is unsustainable.

When it comes to climate finance, oftentimes, people overemphasize the importance of investment but ignoring the importance of long-term market demand.

Primary market investment is critical; however, investment is not revenue stream.

To solve the climate problem, we need startup founders who propose great climate tech solutions to survive and thrive after they receive their first investment or donation. And it all comes down to the long-term market demands.

To accelerate the net-zero transition process, we need the long-term market demands. And that's the space where Optivide aspire to create with system thinking design and regenerative finance.

Solution

Our solution design is based on system thinking with regenerative finance principles. Systems thinking helps people understand complex problems to solve multiple problems in time, at scale, with limited resources, at a higher possible success rate. It prevents today's solution becomes tomorrow's problem.

In our mobile app, our users can:

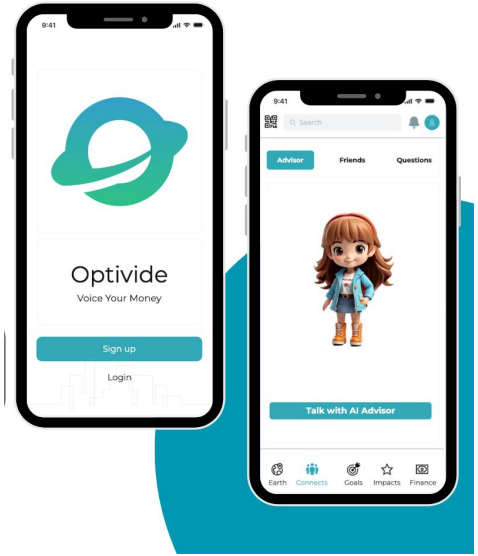

- Prepare Future Goals with Climate Simulation
- Search Climate Solutions Tailored to Your Needs
- Discuss Climate Practices with Global Community

The solution will help them better realize the positive and negative impacts of climate change on their personal goals(retirements, real estate, college tuition) and learn how they could increase their goal success rate by taking sustainability action in their daily lives.
